

Build 1: Memory — Assessment

BUILDING WITH AI

Name _____ Date _____ App _____

SIDE 1 OF 2 — THE EXPLANATION

Part 1

Describe how your app works, from end to end.

Start here: someone you've never met clicks your link on their phone.

End here: something they typed is on your screen, on a different device, the next day.

Tell it as one story, in order. Don't answer it as a list — but by the time you finish, all of this has to be in there:

ALL FIVE HAVE TO APPEAR SOMEWHERE IN YOUR STORY

- what your app saves — name every column in your table, and say what goes in it
- your two views — what each one is for, and why you needed two
- the three things your app does with the saved rows, and which column each one needs to work
- your key — what it lets someone do, and what it doesn't
- your two policies — and why the checking has to happen on Supabase instead of in the visitor's browser

If someone who has never seen your app could read this and then explain it back to me, you got it right.

Part 2

Draw the whole journey, in order.

From someone clicking your link, to them typing something in, to a different person on a different phone seeing it. **Not a picture of the parts — a picture of what happens**, step by step, with arrows going in the direction things actually travel.

Your app lives in three different places. Draw all three, then trace the path between them.

The visitor's browser

a phone or a laptop

GitHub

where your code lives

Supabase

where your data lives

1. Someone opens your link. What gets sent to their browser, and which of the three sent it?
2. Your key is inside that code. Draw it travelling, and show where it ends up.
3. Their browser asks for the saved rows. Who does it ask, and what does it send with the request?
4. Supabase checks whether reading is allowed. Which of the three boxes is that check inside?
5. The rows come back and get drawn on the screen.
6. The person types something in and hits submit. Where does the new row go?
7. Supabase checks whether adding is allowed. Same question: which box?
8. A different person, on a different phone, opens your link — and sees it.

Then write these two answers directly on your drawing, with an arrow to the step that proves each one:

1. Why is it fine for your key to be public?
2. What stops someone deleting everything?
